

CS355 Mini Project Assignment

Autumn 2020

Date: 12th Nov 2020

Due: Wed Nov 18, 2020 11:59 pm

(Final Submission/Video Presentation)

Goal: The goal of this mini project is to provide a realistic experience in the conceptual design, logical design, implementation, operation, and maintenance of a small relational database.

Application description: The application is a package delivery company (similar to FedEx, UPS, DHL, the USPS, etc.). The company needs to keep track of packages shipped and their customers. To find out more about this application, think about any experiences you may have had shipping packages and receiving packages, and browse shippers' web sites. In our hypothetical company, the manager assigned to solicit database design proposals is not very computer literate and is unable to provide a very detailed specification.

Here are a few points to consider:

- There are different kinds of service possibly based upon the type of package (flat envelope, small box, larger boxes, etc.), the weight of the package, and the timeliness of delivery (overnight, second day, or longer).
- Some customers have a contract with the shipper and bill their shipments to an account number. They are billed monthly. Other customers are infrequent customers and pay with a credit card. Certain shipments are prepaid, as is might be the case of someone is returning something that was purchased by phone or Internet (e.g. returning clothes that don't fit, or returning malfunctioning electronics).
- For the most part, the shipping company does not care what is being shipped. However, there are cases where it matters. Some examples include
 - hazardous materials
 - International shipments, for which a customs declaration stating the contents and their value is needed
- The company needs to track packages from the time the customer drops it off (or it is picked up by the company) until the time it is delivered and signed for. Take a look at the online tracking offered by various shipping companies to get an idea of how this service works. If you are having something shipped to you, you'll find you can get every little detail of where the package is, where it has been, and to where it is currently headed. Beyond what the customer sees, the company itself needs to know on which truck or plane or warehouse the package is at any point in time.
- Tracking is not just an "in the present" issue. The company may want to look back in time and find out where the package was yesterday, for example. It may also want to look at data from the standpoint of a truck or warehouse.

- There are other aspects to the operation of the company besides package tracking such as the routing of trucks and planes, the assignment of staff to them, etc. For this assignment, we'll consider only the package handling and billing aspects of the database.

Project requirements:

1. E-R Model

- Construct an E-R diagram representing the conceptual design of the database.
- At minimum you must include all the entity and relationship sets implied by the aforementioned description. You may go beyond the minimum. Remember that the manager who defined the specifications is not computer literate so the specifications should not be viewed as necessarily being precise and complete.
- Be sure to identify primary keys, foreign keys, relationship cardinalities, etc.

2. Relational Model

- After creating an initial relational design from your E-R design, refine it based on the principles of relational design we have studied in the course.
- Create the relations using MySQL database you used for earlier assignments.
- Create indices, constraints, triggers as appropriate.
- If you refine your design, you may discover flaws in the E-R design, go back and change it. Your final E-R design must be consistent with your relational design.

3. Populate Relations

- Include enough data to make answers to your queries interesting and nontrivial. There is no need for overkill in this regard.
- You may write a procedure to generate input data.

4. Queries:

You should run a number of test queries to see that you have loaded your database in the way you intended. The queries listed below are those that your client (the manager from the package delivery company) may want to use frequently. You can plan to write function/procedures/queries to address the followings.

- Assume a delivery truck (say truck no 1721) is destroyed in a crash.
 - Find all customers who had a package on that truck at the time of the crash.
 - Find all recipients who had a package on that truck at the time of the crash.
 - Find the last successful delivery by that truck prior to the crash.
- Find the customer who has shipped the most packages in the past year.
- Find the customer who has spent the most money on shipping in the past year.
- Find the street with the most customers.
- Find those packages that were not delivered within the promised time.
- Take Customer ID and provide the details such as customer name, address, and amount owed.
- A bill listing charges by type of service.
- An itemize billing listing each individual shipment and the charges for it.

5. Deliverable

You need to prepare a project documentation file as well as a video demonstration cum presentation of your project work. You need to record the presentation and share the link during submission. The demonstration (10-15 minutes) must include the followings

- E-R diagram, plus any explanatory notes with a description
- Relational schema with a description
- Your data in the database. Just run `select count(*)` on each of your tables so that we can see how big they are. Export the data of each table in a csv file.
- The code you wrote for each of the listed queries/procedures/functions/index/triggers and the result from running the queries.
- Except the above mentioned queries what are the other interesting queries you can run in your system

Files to be submitted:

- 1) Project documentation file (containing ER Diagram, All the descriptions, MYSQL queries, codes, etc): CS355_rollno.pdf
- 2) All supporting data files in csv format
- 3) A README.txt file for any additional details and Video demonstration/presentation link

Submission instruction will be sent to you later.
